I'm a full-stack developer with a bias towards writing flexible and elegant code that other developers find easy to read, scale and maintain. I'm good at keeping tech-debt at bay.

17+/y total in software engineering strong at OOP used in a functional fashion.

My strongest skill is Object Oriented programming due to several years working with Smalltalk in a variety of projects. From a toll system controlling hardware to a startup building a SaaS with Seaside in the cloud.

6+/y remote work experience in many different teams. I've worked with teammates from Australia, South America, eastern and western Europe, Asia but mostly the U.S.

I've architected and coded software that serves +1 billion transactions per month impacting millions of users.

I've set up a backend update process that did a lossless hot upgrade keeping backward compatibility while serving thousands of transactions per second.

I've taken the [Cheshire II U.C. Berkeley's paper](#) on *probabilistic search* (non-boolean) and implemented it as a software feature in a product.

Open-sourced a [full-stack](#) framework and a [persistence](#) framework, both available in [my GitHub](#) account.

Open-sourced [Merchant](#), an API client to perform [PCI compliant](#) e-commerce transactions also available in my GitHub account.

You can find more about my [developer story](#) here:
